

Feedback

Before Final Plot:

When I had shown my analysis in Tableau to my friends, they were kind of happy and little impressed. When I asked for errors, mistakes or something they did not like in my Analysis some suggested me to change the quantitative month and day values to categorial since it is kind of difficult to filter the month and days with respect to quantitative values. Since quantitative is kind of hard and inefficient to filter the month and days value.

- It is always better to display the full name of the carrier instead of using its code. And the same about the day of week and number of the month. It would be better to read and to understand if it is represented as the actual day (Sunday, Monday,) and months name.
- In the line charts as you have in the third and fourth slides. Please avoid displaying the elements that out of range of the data you have given. For example, 0 and 13 in the x-axis are making no sense in the context so you better remove it. and the same about the 0 and 8 when you presented the days of weeks.
- In the eighth slide, you should explain the meanings of each cancellation code.

After Final Plot:

After I had done changes to the month and Day value to categorial values, it was easy for viewers to filter the data as they wanted. I have updated Cancellation code and even the Airlines Code, so it is easy for the users to look into it. I have kept multiple values in drop down list, it is easy for anyone to filter the month or days easily. They were happy about the questions and Analysis I have given them. Thank you.
